

Spatial Networks Inc. (SNI) is a privately held company based in St. Petersburg, Florida. We have been collecting, analyzing and managing ground collected geospatial data in challenging areas for 17 years. SNI has helped answer some of the toughest questions needed by private businesses and aspects of the US government and continue this mission today.

Our results help customers understand the environment before and often without ever setting foot in the area. Our extensive human capital network lives and collects data in our problem areas. These individuals bring SNI the unique local and intimate understanding of the environment over any outsider.

During our 17 years, we have developed many reasons to ask hard questions in hard areas and get quantifiable results. Companies ask us for data ranging from commodity prices and hours of operation, to traffic patterns and tariffs or taxes. We also provide information for due diligence for mergers and acquisitions, settling insurance claims and quotes, and similar data required to make acutely informed decisions.

We developed a mobile data collection platform called [Fulcrum](#) to create forms on mobile devices, gather data and store in a Postgres database. There are over 40k commercial users gathering and managing their private content. SNI uses Fulcrum to manage forms for all our human capital, to store and track data, and deliver to customers.
